The absolute value is isolated on the left-hand side of the equation, so it's already set up for me to split the equation into two cases. To clear the absolute-value bars, I must split the equation into its two possible two cases, one each for if the contents of the absolute-value bars (that is, if the "argument" of the absolute value) is negative and if it's non-negative (that is, if it's ...

### Solving Simpler Absolute-Value Equations | Purplemath

Absolute value equations are equations where the variable is within an absolute value operator, like  $|x-5|=9$ . The challenge is that the absolute value of a number depends on the number's sign: if it's positive, it's equal to the number:  $|9|=9$ . If the number is negative, then the absolute value is its opposite:  $|-9|=9$ .

Absolute Value Equations. If you answered no, then go on to step 3. Write two equations without absolute values. The first equation will set the quantity inside the bars equal to the number on the other side of the equal sign; the second equation will set the quantity inside the bars equal to the opposite of the number on the other side. Solve the two equations.

And represents the distance between a and 0 on a number line. An absolute value equation is an equation that contains an absolute value expression. Has two solutions  $x = a$  and  $x = -a$  because both numbers are at the distance a from 0. You begin by making it into two separate equations and then solving them separately.
