In analysis, we usually prove inequalities, and we prove those inequalities by estimating. To illustrate the point, consider the following statement. Let x be a real number. If $x < \epsilon$ is true for all real numbers $\epsilon > 0$, then $x = 0$. This statement is the general idea of what we do in analysis. Suppose next we really wish to prove the equality $x = 0$.

Order properties of the real numbers. Every nonempty subset of that has an upper bound has a least upper bound that is also a real number. These order-theoretic properties lead to a number of important results in real analysis, such as the monotone convergence theorem, the intermediate value theorem and the mean value theorem .

Real analysis - Wikipedia

The term “real analysis” is a little bit of a misnomer. I prefer to normally use just “analysis.” The other type of analysis, that is, “complex analysis” really builds up on the present material, rather than being distinct. Furthermore, a more advanced course on “real analysis” would talk about complex numbers often.
