Image Mosaicing And Super Resolution

Image mosaicing is the alignment of multiple images into a large composition which represents part of a 3D scene. Super-resolution is a more sophisticated technique which aims to restore poor-quality video sequences by modelling and removing the degradations inherent in the imaging process, such as noise, blur and spatial-sampling.

Image Mosaicing and Super-resolution | David Capel | Springer

The use of "generic" prior image models in a Bayesian framework is described and shown to produce dramatically improved super-resolution results. Finally, super-resolution algorithms are developed which make use of image models which are tuned to specific classes of image.

The combination of image mosaicing and super-resolution reconstruction, i.e. super-resolution mosaicing, is a powerful means of representing all of the information of multiple overlapping images to obtain a high resolution panoramic view of a scene.

A demosaicing (also de-mosaicing, demosaicking or debayering) algorithm is a digital image process used to reconstruct a full color image from the incomplete color samples output from an image sensor overlaid with a color filter array (CFA). It is also known as CFA interpolation or color reconstruction.

Image mosaicing is the alignment of multiple images into larger compositions which represent portions of a 3D scene. The mosaicing methods described in this chapter are concerned with images which can be registered by means of a planar homography: views of a planar scene from arbitrary viewpoints, or views of a scene taken by a rotating camera.
