Non-Mendelian inheritance patterns Complex and multifactorial inheritance. Some traits or characteristics display continuous variation, a range of phenotypes that cannot be easily divided into clear categories. In many of these cases, the final phenotype is the result of an interaction between genetic factors and environmental influences.

Human matings, like those of experimental organisms, show inheritance patterns both of the type discovered by Mendel (autosomal inheritance) and of sex linkage. Because controlled experimental crosses cannot be made with humans, geneticists must resort to scrutinizing records in the hope that informative matings have been made by chance.

Inheritance Patterns. It is important to understand the basic laws of inheritance to appreciate how conditions are passed on in a family. An accurate family health history is a valuable tool to illustrate how conditions are passed down through generations. All inheritance patterns have been described and depend on the specific cause. However, the majority of cases are of complex inheritance, resulting from multiple genes and environmental factors. Recently, a gene for van der Woude syndrome (VWS), which includes lip pits and CL/P, was identified; the gene is the interferon regulatory factor 6 (IRF6).
