If one crosses two pure lines, one which is homozygous for the dominant trait and one that is homozygous for the recessive trait, the progeny will be heterozygous and have one dominant allele and one recessive allele.

Mendelian trait. A Mendelian trait is one that is controlled by a single locus in an inheritance pattern. In such cases, a mutation in a single gene can cause a disease that is inherited according to Mendel's laws. Examples include sickle-cell anemia, Tay-Sachs disease, cystic fibrosis and xeroderma pigmentosa.

Chapter 11

Mendel's principles alone cannot predict traits that are controlled by multiple alleles or multiple genes. In most organisms, genetics is more complicated, because the majority of genes have more than two alleles. In addition, many important traits are controlled by more than one gene.

11.3 Other Patterns of Inheritance

Some human traits have simple inheritance patterns like the traits that Gregor Mendel studied in pea plants. Other human traits have more complex inheritance patterns. Mendelian inheritance refers to the inheritance of traits controlled by a single gene with two alleles, one of which may be dominant to the other.
