Abstract algebra is the set of advanced topics of algebra that deal with abstract algebraic structures rather than the usual number systems. The most important of these structures are groups, rings, and fields. Important branches of abstract algebra are commutative algebra, representation theory, and homological algebra. Linear algebra, elementary number theory, and discrete mathematics are ...

As a user of both Algebrator 2.0 and 3.0 I have to say that the difference is incredible. I found the old Algebrator useful, but it was really difficult to enter more complex expression.

Field Characteristic. For a field with multiplicative identity 1, consider the numbers  $1, 2, 3, \dots$ , etc. Either these numbers are all different, in which case we say that has characteristic 0, or two of them will be equal. In the latter case, it is straightforward to show that, for some number  $n$ , we have  $n \cdot 1 = 0$ . If  $n$  is chosen to be as small as possible, then  $n$  will be a prime, and we say that has characteristic  $n$ .

In mathematics, and specifically in abstract algebra, an integral domain is a nonzero commutative ring in which the product of any two nonzero elements is nonzero. Integral domains are generalizations of the ring of integers and provide a natural setting for studying divisibility. In an integral domain, every nonzero element  $a$  has the cancellation property, that is, if  $a \neq 0$ , an equality  $ab = ac$  implies  $b = c$ .

In physics, string theory is a theoretical framework in which the point-like particles of particle physics are replaced by one-dimensional objects called strings. It describes how these strings propagate through space and interact with each other. On distance scales larger than the string scale, a string looks just like an ordinary particle, with its mass, charge, and other properties ...

En mathématiques, le théorème fondamental de l'algèbre, aussi appelé théorème de d'Alembert-Gauss et théorème de d'Alembert, indique que tout polynôme non constant, à coefficients complexes, admet au moins une racine. En conséquence, tout polynôme à coefficients entiers, rationnels ou encore réels admet au moins une racine complexe, car ces nombres sont aussi des complexes.
