What is the main difference between an internal combustion engine and an external combustion engine? 1)The burning of fuel occurs inside the cylinder with the piston in an external combustion engine. 2)An internal combustion engine doesn't have a cylinder and a piston.

What is the main difference between an internal combustion ...

In a typical car or truck, that happens in the cylinders to drive the pistons, as described below. But many rocket engines and turbines are considered internal combustion engines as well. With an external combustion engine, the fuel is burned in a separate, external chamber. Here the steam engine is a prime example.

How Does an Internal Combustion Engine Work? | CARFAX Blog

Combustion, also known as burning, is the basic chemical process of releasing energy from a fuel and air mixture. In an internal combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work. The engine consists of a fixed cylinder and ...

Internal-combustion engine, any of a group of devices in which the reactants of combustion

(oxidizer and fuel) and the products of combustion serve as the working fluids of the engine. Such an engine gains its energy from heat released during the combustion of the nonreacted working fluids, the oxidizer-fuel mixture. This process occurs within the engine and is part of the thermodynamic cycle ...
