$1 - p(m; k-1) = 1 - k/m + k p(m; k-1)$: The probabilities $p(m; 1); p(m; 2); \dots; p(m; n)$ can be calculated sequentially using this formula, starting with the initial condition $p(m; 0) = 1$. Solution to Problem 1.22. We derive a recursion for the probability p_i that a white ball is chosen from the i th jar.

Solution to Problem 1.13. In this problem, there is a tendency to reason that since the opposite face is either heads or tails, the desired probability is $1/2$. This is, however, wrong, because given that heads came, it is more likely that the two-headed coin was chosen. The correct reasoning is to calculate the conditional probability

Thus, the desired conditional probability is $10/30 = 1/3$. Solution to Problem 1.15. Let A be the event that the first toss is a head and let B be the event that the second toss is a head. We must compare the conditional probabilities $P(A \cap B | A)$ and $P(A \cap B | A \cup B)$.

12 Sample Space and Probability Chap. 1. that each of the sixteen possible outcomes [ordered pairs (i, j) , with $i, j = 1, 2, 3, 4$], has the same probability of $1/16$. To calculate the probability of an event, we must count the number of elements of event and divide by 16 (the total number of possible outcomes).
