On my system the process $p - 1$ could print to the screen. Printing on any processor other than 0 is not required by an MPI implementation however. Programming Assignment 1 See the code prob3.7.1.c. Calculating who to send a message to is simple and is given by $\text{dest} = (\text{my_rank} + 1) \% p$; as suggested in the text.

The total problem size is proportional to the number of processors used. Goal is to run larger problem in same amount of time. Perfect scaling means problem P_x runs in same time as single

processor run. The ability of a parallel program's performance to scale is a result of a number of interrelated factors.

Building on OS X. Step 1. Build and install OpenCV. The best way to do this is with Homebrew. However, you must slightly alter the Homebrew OpenCV installation; you must build it with `libstdc++` (instead of the default `libc++`) so that it will properly link against the nVidia CUDA dev kit. This entry in the Udacity discussion forums describes...
