In mathematics, an algebra over a field (often simply called an algebra) is a vector space equipped with a bilinear product. Thus, an algebra is an algebraic structure, which consists of a set, together with operations of multiplication, addition, and scalar multiplication by elements of the underlying field, and satisfies the axioms implied by "vector space" and "bilinear".

The possibility of embedding of the set \mathbb{R} of reals into the set of complex numbers \mathbb{C} , as defined by (1), is probably the single most important property of complex numbers. For, without (1) and (2), the theory of complex numbers would not deliver the closure to the branch of algebra that drove much of its development, viz., the search for the roots of polynomial equations.

Elementary algebra is the most basic form of algebra. It is taught to students who are presumed to have no knowledge of mathematics beyond the basic principles of arithmetic. In arithmetic, only numbers and their arithmetical operations (such as $+$, $-$, \times , \div) occur. In algebra, numbers are often represented by symbols called variables (such as a , n , x , y or z).
