The best answer I found was actually in an overview of ordination methods for non-experts by Legendre & Birks 2012 in a chapter of "Tracking Environmental Change using Lake Sediments". The eigenvectors are typically much easier to interpret as they are essentially the coordinates (in reduced space) of a given object along a given axis.

How to interpret variation explained by principal coordinates?

The reaction coordinate diagram for the ozone photolysis reaction is a little different from those above because this is an endothermic reaction. Together, the products O₂ and atomic O, have a higher energy than the reactant O₃ and energy must be added to the system for this reaction. This is primarily due to the very high energy (low ...
